WO 03/055491 A1

## **CHEMICAL COMPOUNDS**

The present invention relates to certain quinazoline derivatives for use in the treatment of certain diseases in particular to proliferative disease such as cancer and in the preparation of medicaments for use in the treatment of proliferative disease, to novel quinazoline compounds and to processes for their preparation, as well as pharmaceutical compositions containing them as active ingredient.

Cancer (and other hyperproliferative disease) is characterised by uncontrolled cellular proliferation. This loss of the normal regulation of cell proliferation often appears to occur as the result of genetic damage to cellular pathways that control progress through the cell cycle.

In eukaryotes, an ordered cascade of protein phosphorylation is thought to control the cell cycle. Several families of protein kinases that play critical roles in this cascade have now been identified. The activity of many of these kinases is increased in human tumours when compared to normal tissue. This can occur by either increased levels of expression of the protein (as a result of gene amplification for example), or by changes in expression of co activators or inhibitory proteins.

The first identified, and most widely studied of these cell cycle regulators have been the cyclin dependent kinases (or CDKs). Activity of specific CDKs at specific times is essential for both initiation and coordinated progress through the cell cycle. For example, the CDK4 protein appears to control entry into the cell cycle (the G0-G1-S transition) by phosphorylating the retinoblastoma gene product pRb. This stimulates the release of the transcription factor E2F from pRb, which then acts to increase the transcription of genes necessary for entry into S phase. The catalytic activity of CDK4 is stimulated by binding to a partner protein, Cyclin D. One of the first demonstrations of a direct link between cancer and the cell cycle was made with the observation that the Cyclin D1 gene was amplified and cyclin D protein levels increased (and hence the activity of CDK4 increased) in many human tumours (Reviewed in Sherr, 1996, Science 274: 1672-1677; Pines, 1995, Seminars in Cancer Biology 6: 63-72). Other studies (Loda et al., 1997, Nature Medicine 3(2): 231-234; Gemma et al., 1996, International Journal of Cancer 68(5): 605-11; Elledge et al. 1996, Trends in Cell Biology 6: 388-392) have shown that negative regulators of CDK function are frequently down regulated or deleted in human tumours again leading to inappropriate activation of these kinases.

-2-

More recently, protein kinases that are structurally distinct from the CDK family have been identified which play critical roles in regulating the cell cycle and which also appear to be important in oncogenesis. These include the newly identified human homologues of the *Drosophila* aurora and *S.cerevisiae* Ipl1 proteins. The three human homologues of these  
5 genes Aurora-A, Aurora-B and Aurora-C (also known as aurora2, aurora1 and aurora3 respectively) encode cell cycle regulated serine-threonine protein kinases (summarised in Adams *et al.*, 2001, Trends in Cell Biology. 11(2): 49-54). These show a peak of expression and kinase activity through G2 and mitosis. Several observations implicate the involvement of human aurora proteins in cancer. This evidence is particularly strong for Aurora-A. The  
10 Aurora-A gene maps to chromosome 20q13, a region that is frequently amplified in human tumours including both breast and colon tumours. Aurora-A may be the major target gene of this amplicon, since Aurora-A DNA is amplified and mRNA overexpressed in greater than 50% of primary human colorectal cancers. In these tumours Aurora-A protein levels appear greatly elevated compared to adjacent normal tissue. In addition, transfection of rodent  
15 fibroblasts with human Aurora-A leads to transformation, conferring the ability to grow in soft agar and form tumours in nude mice (Bischoff *et al.*, 1998, The EMBO Journal. 17(11): 3052-3065). Other work (Zhou *et al.*, 1998, Nature Genetics. 20(2): 189-93) has shown that artificial overexpression of Aurora-A leads to an increase in centrosome number and an increase in aneuploidy, a known event in the development of cancer. Other work has shown  
20 an increase in expression of Aurora-B (Adams *et al.*, 2001, Chromsoma. 110(2):65-74) and Aurora-C (Kimura *et al.*, 1999, Journal of Biological Chemistry, 274(11): 7334-40) in tumour cells when compared to normal cells.

Importantly, it has also been demonstrated that abrogation of Aurora-A expression and function by antisense oligonucleotide treatment of human tumour cell lines (WO 97/22702  
25 and WO 99/37788) leads to cell cycle arrest and exerts an antiproliferative effect in these tumour cell lines. Additionally, small molecule inhibitors of Aurora-A and Aurora-B have been demonstrated to have an antiproliferative effect in human tumour cells (Keen *et al.* 2001, Poster #2455, American Association of Cancer research annual meeting). This indicates that inhibition of the function of Aurora-A (and possibly Aurora-B) will have an antiproliferative  
30 effect that may be useful in the treatment of human tumours and other hyperproliferative diseases. Further, inhibition of Aurora kinases as a therapeutic approach to these diseases may have significant advantages over targeting signalling pathways upstream of the cell cycle (e.g. those activated by growth factor receptor tyrosine kinases such as epidermal growth factor

-3-

receptor (EGFR) or other receptors). Since the cell cycle is ultimately downstream of all of these diverse signalling events, cell cycle directed therapies such as inhibition of Aurora kinases would be predicted to be active across all proliferating tumour cells, whilst approaches directed at specific signalling molecules (e.g. EGFR) would be predicted to be  
5 active only in the subset of tumour cells which express those receptors. It is also believed that significant "cross talk" exists between these signalling pathways meaning that inhibition of one component may be compensated for by another.

A number of quinazoline derivatives have been proposed hitherto for use in the inhibition of various kinases. For example, WO 96/09294, WO 96/15118 and WO 99/06378  
10 describe the use of certain quinazoline compounds as receptor tyrosine kinase inhibitors, which may be useful in the treatment of proliferative disease and WO 00/21955 discloses certain quinazoline derivatives as inhibitors of the effects of VEGF.

Quinazoline derivatives have also been disclosed for use in the inhibition of Aurora-A kinase. WO 02/00649 discloses quinazoline derivative bearing a 5-membered heteroaromatic  
15 ring where the ring is, in particular, substituted thiazole or substituted thiophene. However despite the compounds of WO 02/00649 there still exists the need for further compounds having Aurora kinase inhibitory properties.

The applicants have been successful in finding a novel series of compounds which inhibit the effects of the Aurora kinases and in particular Aurora-A kinase and which are thus  
20 of use in the treatment of proliferative disease such as cancer, in particular in such diseases such as colorectal or breast cancer where Aurora kinases are known to be active.

- 25 In this specification the term alkyl when used either alone or as a suffix or prefix includes straight-chain and branched-chain saturated structures comprising carbon and hydrogen atoms. Unless otherwise stated, these groups may contain up to 10 carbon atoms (C<sub>1-10</sub>alkyl), preferably up to 6 carbon atoms (C<sub>1-6</sub>alkyl) and more preferably up to 4 carbon atoms (C<sub>1-4</sub>alkyl). References to individual alkyl groups are specific for the straight-chain
- 30 version only and references to individual branched-chain alkyl groups such as *t*-butyl are specific for the branched chain version only. For example C<sub>1-4</sub>alkyl includes the examples of methyl, ethyl, propyl, butyl and *tert*-butyl where the ethyl, propyl and butyl groups may be

bonded at the 1 or 2 position (e.g. prop-1-yl and prop-2-yl). A similar analysis of alkyl groups having different ranges of carbon atoms can be performed.

Similarly the terms alkenyl and alkynyl refer to unsaturated straight-chain or branched-chain structures containing for example from 2 to 10 carbon atoms ( $C_{2-10}$ alkenyl and  $C_{2-10}$ alkynyl) and preferably from 2 to 6 carbon atoms ( $C_{2-6}$ alkenyl and  $C_{2-6}$ alkynyl) and more preferably 2 to 4 carbon atoms ( $C_{2-4}$ alkenyl and  $C_{2-4}$ alkynyl). Again references to individual groups are specific for the straight-chain version only and references to individual branched-chain groups are specific for the branched chain version only. The above comment concerning the bonding position of alkyl is applicable to alkenyl and alkynyl groups.

Cyclic moieties such as cycloalkyl, cycloalkenyl and cycloalkynyl are similar in nature but have at least 3 carbon atoms, the following terms thus being used in the specification to indicate the minimum and maximum number of carbon atoms in the rings:  $C_{3-10}$ cycloalkyl,  $C_{3-10}$ cycloalkenyl and  $C_{3-10}$ cycloalkynyl and preferably  $C_{3-6}$ cycloalkyl,  $C_{3-6}$ cycloalkenyl and  $C_{3-6}$ cycloalkynyl and most preferably  $C_{3-4}$ cycloalkyl.

Terms such as alkoxy comprise alkyl groups as is understood in the art and thus contain up to 10 carbon atoms ( $C_{1-10}$ alkoxy), preferably up to 6 carbon atoms ( $C_{1-6}$ alkoxy) and more preferably up to 4 carbon atoms ( $C_{1-4}$ alkoxy).

The term halo includes fluoro, chloro, bromo and iodo.

References to aryl groups include aromatic carbocyclic groups such as phenyl and naphthyl.

The terms heterocyclyl and heterocyclic group include (unless specifically stated) aromatic or non-aromatic rings and may comprise more than one ring (e.g. they are monocyclic, bicyclic or tricyclic and preferably they are monocyclic and bicyclic), for example containing from 4 to 20, suitably from 5 to 8 ring atoms, at least one of which is a heteroatom such as oxygen, sulphur or nitrogen. Examples of such groups include furyl, thienyl, pyrrolyl, pyrrolidinyl, imidazolyl, triazolyl, thiazolyl, tetrazolyl, oxazolyl, isoxazolyl, pyrazolyl, pyridyl, pyrimidinyl, pyrazinyl, pyridazinyl, triazinyl, quinolinyl, isoquinolinyl, quinoxalinyl, benzothiazolyl, benzoxazolyl, benzothienyl or benzofuryl.

Heteroaryl refers to those heterocyclyl groups described above which have an aromatic character.

The term aralkyl refers to aryl substituted alkyl groups such as benzyl.

## -15-

Other expressions used in the specification include hydrocarbyl which refers to any structure comprising carbon and hydrogen atoms. For example, these may be alkyl, alkenyl, alkynyl, aryl, heterocyclyl, alkoxy, aralkyl, cycloalkyl, cycloalkenyl or cycloalkynyl.

The term functional group refers to reactive substituents such as nitro, cyano, halo, oxo,  $=CR^{78}R^{79}$ ,  $C(O)_xR^{77}$ ,  $OR^{77}$ ,  $S(O)_yR^{77}$ ,  $NR^{78}R^{79}$ ,  $C(O)NR^{78}R^{79}$ ,  $OC(O)NR^{78}R^{79}$ ,  $=NOR^{77}$ ,  $-NR^{77}C(O)_xR^{78}$ ,  $-NR^{77}CONR^{78}R^{79}$ ,  $-N=CR^{78}R^{79}$ ,  $S(O)_yNR^{78}R^{79}$  or  $-NR^{77}S(O)_yR^{78}$  where  $R^{77}$ ,  $R^{78}$  and  $R^{79}$  are independently selected from hydrogen or optionally substituted hydrocarbyl, or  $R^{78}$  and  $R^{79}$  together form an optionally substituted ring which optionally contains further heteroatoms such as  $S(O)_y$  oxygen and nitrogen, x is an integer of 1 or 2, y is 0, 1, 2 or 3.

Suitable optional substituents for hydrocarbyl groups  $R^{77}$ ,  $R^{78}$  and  $R^{79}$  include halo, perhaloalkyl such as trifluoromethyl, mercapto, hydroxy, carboxy, alkoxy, aryl, heteroaryl, heteroaryloxy, alkenyloxy, alkynyloxy, alkoxyalkoxy, aryloxy (where the aryl group may be substituted by halo, nitro, or hydroxy), cyano, nitro, amino, mono- or di-alkyl amino, oximino or  $S(O)_y$  where y is as defined above.

Suitable optional substituents for any hydrocarbyl group, heterocyclyl group or  $C_{1-10}$ alkoxy group (unless specifically stated) include halo, perhaloalkyl such as trifluoromethyl, mercapto, hydroxy, carboxy, alkoxy, aryl, heteroaryl, heteroaryloxy, alkenyloxy, alkynyloxy, alkoxyalkoxy, aryloxy (where the aryl group may be substituted by halo, nitro, or hydroxy), cyano, nitro, amino, mono- or di-alkyl amino, oximino or  $S(O)_y$  where y is as defined above.

Where optional substituents are chosen from one of more groups or substituents it is to be understood that this definition includes all substituents being chosen from one of the specified groups i.e. all substituents being the same, or the substituents being chosen from two or more of the specified groups i.e. the substituents not being the same. Preferably one or more means 1, 2, 3 or 4 but one or more may also means 1, 2 or 3 or 1 or 2.

Where a compound of formula (I), formula (IA) or formula (IB) contains more than one specific R group it is to be understood that each selection made for such a group is independent from any other selection made for that same group, for example when a compound of formula (I) contains more than one  $R^{77}$  group, each  $R^{77}$  group can be the same as the other  $R^{77}$  groups or different.

Within this specification composite terms are used to describe group comprising more than one functionality such as  $C_{1-3}$ alkoxy $C_{2-3}$ alkyl. Such terms are to be interpreted as is understood in the art.

**-16-**

Unless specifically stated the bonding atom of a group may be any atom of that group so for example propyl includes prop-1-yl and prop-2-yl.

Suitable values for any of the R groups ( $R^1$  to  $R^{96}$ ) or any part or substituents for such groups include:-

Within the present invention it is to be understood that a compound of the formula (I), formula (IA) or formula (IB) or a salt, ester or amide thereof may exhibit the phenomenon of tautomerism and that the formulae drawings within this specification can represent only one of the possible tautomeric forms. It is to be understood that the invention encompasses any

15 tautomeric form which has Aurora kinase inhibition activity and in particular Aurora-A kinase or Aurora-B kinase inhibition activity and is not to be limited merely to any one tautomeric form utilized within the formulae drawings. The formulae drawings within this specification can represent only one of the possible tautomeric forms and it is to be understood that the specification encompasses all possible tautomeric forms of the compounds drawn not just

20 those forms which it has been possible to show graphically herein. The possibility of tautomeric forms is particular pertinent for R<sup>5</sup> when R<sup>62</sup> is hydrogen.

It is also to be understood that, insofar as certain compounds of the invention may exist in optically active or racemic forms by virtue of one of more racemic carbon or sulphur atom, the invention includes in its definition any such optically active or racemic form which

25 possesses Aurora kinase inhibitory activity and in particular Aurora-A kinase inhibitory activity. The synthesis of optically active forms may be carried out by standard techniques of organic chemistry well known in the art, for example by synthesis from optically active starting materials or by resolution of a racemic form.

It is also to be understood that certain compounds of the formula (I), formula (IA) or

30 formula (IB) and salts thereof can exist in solvated as well as unsolvated forms such as, for example, hydrated forms. It is to be understood that the invention encompasses all such solvated forms which have Aurora kinase inhibition activity and in particular Aurora-A kinase inhibition activity.

Compounds of the present invention have been named using computer software (ACD/Name version 6.6 or ACD/ Name batch version 6.0).

The present invention relates to the compounds of formula (I), formula (IA) or formula (IB) as defined herein as well as to the salts thereof. Salts for use in pharmaceutical compositions will be pharmaceutically acceptable salts, but other salts may be useful in the production of compounds of formula (I), formula (IA) or formula (IB) and their pharmaceutically acceptable salts. Suitable pharmaceutically acceptable salts of compounds of formula (I), formula (IA) or formula (IB) include acid addition salts such as methanesulphonate, fumarate, hydrochloride, hydrobromide, citrate, maleate and salts formed with phosphoric and sulphuric acid. There may be more than one cation or anion depending on the number of charged functions and the valency of the cations or anions. Where the compound of formula (I), formula (IA) or formula (IB) includes an acid functionality, salts may be base salts such as an alkali metal salt for example sodium, an alkaline earth metal salt for example calcium or magnesium, an organic amine salt for example triethylamine, morpholine, *N*-methylpiperidine, *N*-ethylpiperidine, procaine, dibenzylamine, *N,N*-dibenzylethylamine, ethanolamine, diethanolamine or amino acids for example lysine. A preferred pharmaceutically acceptable salt is a sodium salt.

The invention also provides for an *in vivo* hydrolysable ester of a compound of formula (I), formula (IA) or formula (IB) containing carboxy or hydroxy group. Such an ester is, for example, a pharmaceutically acceptable ester which is hydrolysed in the human or animal body to produce the parent acid or alcohol.

Suitable pharmaceutically acceptable esters for carboxy include C<sub>1-6</sub>alkyl esters such as methyl or ethyl esters, C<sub>1-6</sub>alkoxymethyl esters for example methoxymethyl, C<sub>1-6</sub>alkanoyloxymethyl esters for example pivaloyloxymethyl, phthalidyl esters, C<sub>3-8</sub>cycloalkoxy-carbonyloxyC<sub>1-6</sub>alkyl esters for example 1-cyclohexylcarbonyloxyethyl; 1,3-dioxolen-2-onylmethyl esters for example 5-methyl-1,3-dioxolen-2-onylmethyl; and C<sub>1-6</sub>alkoxycarbonyloxyethyl esters for example 1-methoxycarbonyloxyethyl and may be formed at any carboxy group in the compounds of this invention.

An *in vivo* hydrolysable ester of a compound of formula (I), formula (IA) or formula (IB) containing a hydroxy group includes inorganic esters such as phosphate esters and  $\alpha$ -acyloxyalkyl ethers and related compounds which as a result of the *in vivo* hydrolysis of the ester breakdown to give the parent hydroxy group. Examples of  $\alpha$ -acyloxyalkyl ethers include

-45-

acetoxymethoxy and 2,2-dimethylpropionyloxymethoxy. A selection of *in vivo* hydrolysable ester forming groups for hydroxy include alkanoyl, benzoyl, phenylacetyl and substituted benzoyl and phenylacetyl, alkoxycarbonyl (to give alkyl carbonate esters), dialkylcarbamoyl and *N*-(dialkylaminoethyl)-*N*-alkylcarbamoyl (to give carbamates), dialkylaminoacetyl and

5 carboxyacetyl.

Suitable amides are derived from compounds of formula (I), formula (IA) or formula (IB) which have a carboxy group which is derivatised into an amide such as a *N*-C<sub>1-6</sub>alkyl and *N,N*-di-(C<sub>1-6</sub>alkyl)amide such as *N*-methyl, *N*-ethyl, *N*-propyl, *N,N*-dimethyl, *N*-ethyl-*N*-methyl or *N,N*-diethylamide.

10 Preferred compounds of formula (I), formula (IA) or formula (IB) are those that are stable in mouse, rat, or human serum, preferably those that are stable in human serum.

Esters which are not *in vivo* hydrolysable may be useful as intermediates in the production of the compounds of formula (I), formula (IA) or formula (IB).

Compounds of formula (I), formula (IA) or formula (IB) may be prepared by various

15 methods which would be apparent from the literature. For example compounds of formula (I), formula (IA) or formula (IB) where X is NH may be prepared by reacting a compound of formula (VII)

20 where R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, and R<sup>4</sup> are R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, and R<sup>4</sup> as defined in relation to formula (I) or formula (IB) or R<sup>1'</sup>, R<sup>2'</sup>, R<sup>3'</sup>, and R<sup>4'</sup> as defined in relation to formula (IA) and R<sup>85</sup> is a group NR<sup>86</sup>R<sup>87</sup> where R<sup>86</sup> and R<sup>87</sup> are independently selected from alkyl such as methyl, with a compound of formula (VIII)

25

-46-

where  $R^{5'}$  is a group  $R^5$  as defined in relation to formula (I) or a group  $R^{5a}$  as defined in relation to formula (IA) or a precursor group thereof; and thereafter if desired or necessary, converting a precursor group  $R^{5'}$  to a group  $R^5$  or  $R^{5a}$  and/or modifying substituents on the group  $R^5$  or  $R^{5a}$ . The reaction is suitably effected in an organic solvent such as an acetic acid

5 at elevated temperatures, conveniently at the reflux temperature of the solvent.

Examples of reactions in which a precursor group  $R^{5'}$  is converted to a group  $R^5$  or  $R^{5a}$  and/or substituents on the group  $R^5$  or  $R^{5a}$  are modified are standard chemical reactions, such as conversion of esters to acids, and thereafter, if required to the preferred amides. Examples of such reactions are provided hereinafter.

10 Compounds of formula (VII) are suitably prepared by reacting a compound of formula (IX)

15 with an appropriate acetal such as *N,N*-dimethylformamide dimethyl acetal. The reaction is suitably effected in an organic solvent such as benzene, at elevated temperature, conveniently at the reflux temperature of the solvent.

Alternatively compounds of formula (I), formula (IA) or formula (IB) may be prepared by reacting a compound of formula (X)

-47-

where  $R^{1'}$ ,  $R^{2''}$ ,  $R^{3''}$ , and  $R^{4'}$  are equivalent to a group  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  as defined in relation to formula (I) or formula (IB) or  $R^{1'}$ ,  $R^{2'}$ ,  $R^{3'}$  and  $R^{4'}$  as defined in relation formula (IA) or a precursor thereof, and  $R^{85}$  is a leaving group, with a compound of formula (XI)

- 5 where X as defined in relation to formula (I) or formula (IA) and  $R^5$  is  $R^5$  as defined in relation to formula (I) or  $R^{5a}$  as defined in relation to formula (IA): and thereafter if desired or necessary converting a group  $R^{1'}$ ,  $R^{2''}$ ,  $R^{3''}$  or  $R^{4'}$  to a group  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  respectively or a group  $R^{1'}$ ,  $R^{2'}$ ,  $R^{3'}$  and  $R^{4'}$  respectively or to a different such group.

Suitable leaving groups for  $R^{85}$  include halo such as chloro, mesylate and tosylate.

- 10 The reaction is suitably effected in an organic solvent such as an alcohol like isopropanol, at elevated temperatures, conveniently at the reflux temperature of the solvent.

The conversion of a group  $R^{1'}$ ,  $R^{2''}$ ,  $R^{3''}$  or  $R^{4'}$  to a group  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  respectively or to a group  $R^{1'}$ ,  $R^{2'}$ ,  $R^{3'}$  and  $R^{4'}$  respectively or to a different such group, may be particularly useful in connection with the preparation of compounds of formula (I), formula (IA) or

- 15 formula (IB) where these groups are complex in nature and examples of these preparations are provided hereinafter.

In a particular embodiment,  $R^{1'}$ ,  $R^{2''}$ ,  $R^{3''}$  or  $R^{4'}$  are groups  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  respectively.

- Compounds of formula (X) and (XI) are either known compounds or they can be  
20 derived from known compounds by conventional methods which would be apparent from the literature.

Alternatively, compounds of formula (I), formula (IA) or formula (IB) where X is NH may be prepared by rearranging a compound of formula (XII)

(XII)

-48-

where  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  are  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  as defined in relation to formula (I) or formula (IB) or  $R^{1'}$ ,  $R^{2'}$ ,  $R^{3'}$  and  $R^{4'}$  as defined in relation to formula (IA) and  $R^{5'}$  is as defined in relation to formula (VIII) above, and thereafter if desired or necessary, converting a precursor group  $R^{5'}$  to a group  $R^5$  or  $R^{5a}$  and/or modifying substituents on the group  $R^5$  or  $R^{5a}$ , for

5 example as described generally above.

The rearrangement reaction is suitably effected in an organic solvent such as an alkyl alcohol, in particular methanol, ethanol or cyclohexanol, acetic acid, or dimethylformamide, using a strong base such as sodium hydride, sodium hydroxide, sodium acetate, sodium methylate, or dimethylamine. Elevated temperatures, for example of from 20°-120°C and

10 preferably at about 75°C are employed.

Compounds of formula (XII) are suitably obtained by reacting a compound of formula (XIII)

(XIII)

where  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  are  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  as defined in relation to formula (I) or formula (IB) or  $R^{1'}$ ,  $R^{2'}$ ,  $R^{3'}$  and  $R^{4'}$  as defined in relation to formula (IA) and  $R^{86}$  is an alkyl group such as methyl; with a compound of formula (XIV)

where  $R^{5'}$  is as defined in relation to formula (VIII). The reaction is suitably effected in an organic solvent such as methylene chloride, in the presence of a salt such as pyridinium hydrochloride. Moderate temperatures for example of from 0°-50°C and conveniently ambient temperature are employed.

25

-49-

Compounds of formula (XIII) are suitably prepared by reacting a compound of formula (IX) as defined above, with a trialkylorthoformate such as trimethylorthoformate. The reaction is suitably effected at elevated temperature, for example of from 50°C to 120°C, and preferably at about 100°C, in the presence of a catalytic amount of an acid such as p-toluene  
 5 sulphonic acid.

Compounds of formula (IX) are either known compounds or they can be prepared by conventional methods. In particular, compounds of formula (IX) may be prepared by reduction of the corresponding nitro compound of formula (XV)

(XV)

10

where  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  are  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  as defined in relation to formula (I) or formula (IB) or  $R^{1'}$ ,  $R^{2'}$ ,  $R^{3'}$  and  $R^{4'}$  as defined in relation to formula (IA). Suitable reaction conditions are illustrated hereinafter.

15 Compounds of formula (XV) may be obtained by nitration of a compound of formula (XVI)

(XVI)

for example, using nitric acid as the nitrating agent. Again, suitable reaction conditions are  
 20 illustrated hereinafter.

The nitrile of formula (XVI) may be derived by reaction of the corresponding formamide with hydroxylamine as illustrated hereinafter.

It will be appreciated that certain of the various ring substituents in the compounds of the present invention may be introduced by standard aromatic substitution reactions or  
5 generated by conventional functional group modifications either prior to or immediately following the processes mentioned above, and as such are included in the process aspect of the invention. Such reactions and modifications include, for example, introduction of a substituent by means of an aromatic substitution reaction, reduction of substituents, alkylation of substituents and oxidation of substituents. The reagents and reaction conditions for such  
10 procedures are well known in the chemical art. Particular examples of aromatic substitution reactions include the introduction of a nitro group using concentrated nitric acid, the introduction of an acyl group using, for example, an acyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; the introduction of an alkyl group using an alkyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts  
15 conditions; and the introduction of a halogen group. Particular examples of modifications include the reduction of a nitro group to an amino group by for example, catalytic hydrogenation with a nickel catalyst or treatment with iron in the presence of hydrochloric acid with heating; oxidation of alkylthio to alkylsulphinyl or alkylsulphonyl.

It will also be appreciated that in some of the reactions mentioned herein it may be  
20 necessary/desirable to protect any sensitive groups in the compounds. The instances where protection is necessary or desirable and suitable methods for protection are known to those skilled in the art. Conventional protecting groups may be used in accordance with standard practice (for illustration see T.W. Green, Protective Groups in Organic Synthesis, John Wiley and Sons, 1991). Thus, if reactants include groups such as amino, carboxy or hydroxy it may  
25 be desirable to protect the group in some of the reactions mentioned herein.

A suitable protecting group for an amino or alkylamino group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an alkoxycarbonyl group, for example a methoxycarbonyl, ethoxycarbonyl or *t*-butoxycarbonyl group, an arylmethoxycarbonyl group, for example benzyloxycarbonyl, or an aroyl group, for example benzoyl. The deprotection  
30 conditions for the above protecting groups necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or alkoxycarbonyl group or an aroyl group may be removed for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an acyl group such

## -51-

as a *t*-butoxycarbonyl group may be removed, for example, by treatment with a suitable acid as hydrochloric, sulphuric or phosphoric acid or trifluoroacetic acid and an arylmethoxycarbonyl group such as a benzyloxycarbonyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon, or by treatment with a Lewis  
5 acid for example boron tris(trifluoroacetate). A suitable alternative protecting group for a primary amino group is, for example, a phthaloyl group which may be removed by treatment with an alkylamine, for example dimethylaminopropylamine, or with hydrazine.

A suitable protecting group for a hydroxy group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an aroyl group, for example benzoyl, or an  
10 arylmethyl group, for example benzyl. The deprotection conditions for the above protecting groups will necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or an aroyl group may be removed, for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an arylmethyl group such as a benzyl group may be removed, for example, by  
15 hydrogenation over a catalyst such as palladium-on-carbon.

A suitable protecting group for a carboxy group is, for example, an esterifying group, for example a methyl or an ethyl group which may be removed, for example, by hydrolysis with a base such as sodium hydroxide, or for example a *t*-butyl group which may be removed, for example, by treatment with an acid, for example an organic acid such as trifluoroacetic  
20 acid, or for example a benzyl group which may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

The protecting groups may be removed at any convenient stage in the synthesis using conventional techniques well known in the chemical art.

Dispersible or lyophilised powders and granules suitable for preparation of an aqueous suspension or solution by the addition of water generally contain the active ingredient together  
20 with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients such as sweetening, flavouring and colouring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of

30 condensation products of the said partial esters with ethylene oxide such as polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening, flavouring and preservative agents.

Syrups and elixirs may be formulated with sweetening agents such as glycerol, propylene glycol, sorbitol, aspartame or sucrose, and may also contain a demulcent, preservative, flavouring and/or colouring agent.

The pharmaceutical compositions may also be in the form of a sterile injectable  
5 aqueous or oily suspension, solutions, emulsions or particular systems, which may be formulated according to known procedures using one or more of the appropriate dispersing or wetting agents and suspending agents, which have been mentioned above. A sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example a solution in polyethylene glycol.

10 Suppository formulations may be prepared by mixing the active ingredient with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Suitable excipients include, for example, cocoa butter and polyethylene glycols.

Topical formulations, such as creams, ointments, gels and aqueous or oily solutions or  
15 suspensions, may generally be obtained by formulating an active ingredient with a conventional, topically acceptable, vehicle or diluent using conventional procedure well known in the art.

Compositions for administration by insufflation may be in the form of a finely divided powder containing particles of average diameter of, for example, 30 $\mu$ m or much less  
20 preferably 5 $\mu$ m or less and more preferably between 5 $\mu$ m and 1 $\mu$ m, the powder itself comprising either active ingredient alone or diluted with one or more physiologically acceptable carriers such as lactose. The powder for insufflation is then conveniently retained in a capsule containing, for example, 1 to 50mg of active ingredient for use with a turbo-inhaler device, such as is used for insufflation of the known agent sodium cromoglycate.

25 Compositions for administration by inhalation may be in the form of a conventional pressurised aerosol arranged to dispense the active ingredient either as an aerosol containing finely divided solid or liquid droplets. Conventional aerosol propellants such as volatile fluorinated hydrocarbons or hydrocarbons may be used and the aerosol device is conveniently arranged to dispense a metered quantity of active ingredient.

The amount of active ingredient that is combined with one or more excipients to produce a single dosage form will necessarily vary depending upon the host treated and the particular route of administration. For example, a formulation intended for oral administration to humans will generally contain, for example, from 0.5 mg to 2 g of active agent

5 compounded with an appropriate and convenient amount of excipients which may vary from about 5 to about 98 percent by weight of the total composition. Dosage unit forms will generally contain about 1 mg to about 500 mg of an active ingredient. For further information on Routes of Administration and Dosage Regimes the reader is referred to Chapter 25.3 in Volume 5 of Comprehensive Medicinal Chemistry (Corwin Hansch; Chairman of Editorial  
10 Board), Pergamon Press 1990.

The size of the dose for therapeutic or prophylactic purposes of a compound of the formula (I), formula (IA) or formula (IB) will naturally vary according to the nature and severity of the conditions, the age and sex of the animal or patient and the route of administration, according to well known principles of medicine. As mentioned above,

15 compounds of the formula (I), formula (IB) or formula (IA) are useful in treating diseases or medical conditions which are due alone or in part to the effects of Aurora-A kinase and also due alone or in part to the effects of Aurora-B kinase.

In using a compound of the formula (I), formula (IA) or formula (IB) for therapeutic or prophylactic purposes it will generally be administered so that a daily dose in the range, for  
20 example, 0.5 mg to 75 mg per kg body weight is received and but a range of 0.1 mg to 75 mg may also be required, given if required in divided doses. In general lower doses will be administered when a parenteral route is employed. Thus, for example, for intravenous administration, a dose in the range, for example, 0.5 mg to 30 mg per kg body weight will generally be used but a range of 0.1 mg to 25 mg may be required. Similarly, for  
25 administration by inhalation, a dose in the range, for example, 0.5 mg to 25 mg per kg body weight will be used.

A further aspect of the invention comprises a compound of formula (I), formula (IA) or formula (IB) as defined above, or a pharmaceutically acceptable salt or in vivo hydrolysable ester thereof, for use in the preparation of a medicament for the treatment of proliferative  
30 disease. Preferred compounds of formula (I), formula (IA) or formula (IB) for this purpose are as described above.

In addition to their use in therapeutic medicine, a compound of formula (I) or formula (IA) and the pharmaceutically acceptable salt is also useful as pharmacological tool in the

-60-

development and standardisation of *in vitro* and *in vivo* test systems for the evaluation of the effects of inhibitors of cell cycle activity in laboratory animals such as cats, dogs, rabbits, monkeys, rats and mice, as part of the search for new therapeutic agents.

Such conjoint treatment may be achieved by way of the simultaneous, sequential or separate dosing of the individual components of the treatment. Such combination products employ the compounds of this invention within the dosage range described hereinbefore and the other

30 pharmaceutically-active agent within its approved dosage range.

As stated hereinbefore the compounds of the invention inhibit the serine-threonine kinase activity of Aurora kinase and in particular of Aurora-A kinase and/or Aurora-B kinase and

thus inhibit the cell cycle and cell proliferation. These properties may be assessed, for example, using one or more of the procedures set out below:

(a) In Vitro Aurora-A kinase inhibition test

5 This assay determines the ability of a test compound to inhibit serine-threonine kinase activity. DNA encoding Aurora-A may be obtained by total gene synthesis or by cloning. This DNA may then be expressed in a suitable expression system to obtain polypeptide with serine-threonine kinase activity. In the case of Aurora-A, the coding sequence was isolated from cDNA by polymerase chain reaction (PCR) and cloned into the BamH1 and Not1 restriction  
10 endonuclease sites of the baculovirus expression vector pFastBac HTc (GibcoBRL/Life technologies). The 5' PCR primer contained a recognition sequence for the restriction endonuclease BamH1 5' to the Aurora-A coding sequence. This allowed the insertion of the Aurora-A gene in frame with the 6 histidine residues, spacer region and rTEV protease cleavage site encoded by the pFastBac HTc vector. The 3' PCR primer replaced the Aurora-A  
15 stop codon with additional coding sequence followed by a stop codon and a recognition sequence for the restriction endonuclease Not1. This additional coding sequence (5' TAC CCA TAC GAT GTT CCA GAT TAC GCT TCT TAA 3') encoded for the polypeptide sequence YPYDVDPDYAS. This sequence, derived from the influenza hemagglutinin protein, is frequently used as a tag epitope sequence that can be identified using specific monoclonal  
20 antibodies. The recombinant pFastBac vector therefore encoded for an N-terminally 6 his tagged, C terminally influenza hemagglutinin epitope tagged Aurora-A protein. Details of the methods for the assembly of recombinant DNA molecules can be found in standard texts, for example Sambrook et al. 1989, Molecular Cloning - A Laboratory Manual, 2<sup>nd</sup> Edition, Cold Spring Harbor Laboratory press and Ausubel et al. 1999, Current Protocols in Molecular  
25 Biology, John Wiley and Sons Inc.

Production of recombinant virus can be performed following manufacturer's protocol from GibcoBRL. Briefly, the pFastBac-1 vector carrying the Aurora-A gene was transformed into E. coli DH10Bac cells containing the baculovirus genome (bacmid DNA) and via a transposition event in the cells, a region of the pFastBac vector containing gentamycin  
30 resistance gene and the Aurora-A gene including the baculovirus polyhedrin promoter was transposed directly into the bacmid DNA. By selection on gentamycin, kanamycin, tetracycline and X-gal, resultant white colonies should contain recombinant bacmid DNA encoding Aurora-A. Bacmid DNA was extracted from a small scale culture of several

-63-

BH10Bac white colonies and transfected into *Spodoptera frugiperda* Sf21 cells grown in TC100 medium (GibcoBRL) containing 10% serum using CellFECTIN reagent (GibcoBRL) following manufacturer's instructions. Virus particles were harvested by collecting cell culture medium 72 hrs post transfection. 0.5 mls of medium was used to infect 100 ml suspension  
5 culture of Sf21s containing  $1 \times 10^7$  cells/ml. Cell culture medium was harvested 48 hrs post infection and virus titre determined using a standard plaque assay procedure. Virus stocks were used to infect Sf9 and "High 5" cells at a multiplicity of infection (MOI) of 3 to ascertain expression of recombinant Aurora-A protein.

For the large scale expression of Aurora-A kinase activity, Sf21 insect cells were grown at  
10 28°C in TC100 medium supplemented with 10% foetal calf serum (Viralex) and 0.2% F68 Pluronic (Sigma) on a Wheaton roller rig at 3 r.p.m. When the cell density reached  $1.2 \times 10^6$  cells ml<sup>-1</sup> they were infected with plaque-pure Aurora-A recombinant virus at a multiplicity of infection of 1 and harvested 48 hours later. All subsequent purification steps were performed at 4°C. Frozen insect cell pellets containing a total of  $2.0 \times 10^8$  cells were thawed  
15 and diluted with lysis buffer (25 mM HEPES (N-[2-hydroxyethyl]piperazine-N'-[2-ethanesulphonic acid]) pH7.4 at 4°C, 100 mM KCl, 25 mM NaF, 1 mM Na<sub>3</sub>VO<sub>4</sub>, 1 mM PMSF (phenylmethylsulphonyl fluoride), 2 mM 2-mercaptoethanol, 2 mM imidazole, 1 µg/ml aprotinin, 1 µg/ml pepstatin, 1 µg/ml leupeptin), using 1.0 ml per  $3 \times 10^7$  cells. Lysis was achieved using a dounce homogeniser, following which the lysate was centrifuged at 41,000g  
20 for 35 minutes. Aspirated supernatant was pumped onto a 5 mm diameter chromatography column containing 500 µl Ni NTA (nitrilo-tri-acetic acid) agarose (Qiagen, product no. 30250) which had been equilibrated in lysis buffer. A baseline level of UV absorbance for the eluent was reached after washing the column with 12 ml of lysis buffer followed by 7 ml of wash buffer (25 mM HEPES pH7.4 at 4°C, 100 mM KCl, 20 mM imidazole, 2 mM 2-  
25 mercaptoethanol). Bound Aurora-A protein was eluted from the column using elution buffer (25 mM HEPES pH7.4 at 4°C, 100 mM KCl, 400 mM imidazole, 2 mM 2-mercaptoethanol). An elution fraction (2.5 ml) corresponding to the peak in UV absorbance was collected. The elution fraction, containing active Aurora-A kinase, was dialysed exhaustively against dialysis buffer (25 mM HEPES pH7.4 at 4°C, 45% glycerol (v/v), 100 mM KCl, 0.25% Nonidet P40  
30 (v/v), 1 mM dithiothreitol).

Each new batch of Aurora-A enzyme was titrated in the assay by dilution with enzyme diluent (25mM Tris-HCl pH7.5, 12.5mM KCl, 0.6mM DTT). For a typical batch, stock

-64-

enzyme is diluted 1 in 666 with enzyme diluent & 20 $\mu$ l of dilute enzyme is used for each assay well. Test compounds (at 10mM in dimethylsulphoxide (DMSO)) were diluted with water & 10 $\mu$ l of diluted compound was transferred to wells in the assay plates. "Total" & "blank" control wells contained 2.5% DMSO instead of compound. Twenty microlitres of  
5 freshly diluted enzyme was added to all wells, apart from "blank" wells. Twenty microlitres of enzyme diluent was added to "blank" wells. Twenty microlitres of reaction mix (25mM Tris-HCl, 78.4mM KCl, 2.5mM NaF, 0.6mM dithiothreitol, 6.25mM MnCl<sub>2</sub>, 6.25mM ATP, 7.5 $\mu$ M peptide substrate [biotin-LRRWSLGLRRWSLGLRRWSLGLRRWSLG]) containing 0.2 $\mu$ Ci [ $\gamma$ <sup>33</sup>P]ATP (Amersham Pharmacia, specific activity  $\geq$ 2500Ci/mmol) was then added to  
10 all test wells to start the reaction. The plates were incubated at room temperature for 60 minutes. To stop the reaction 100 $\mu$ l 20% v/v orthophosphoric acid was added to all wells. The peptide substrate was captured on positively-charged nitrocellulose P30 filtermat (Whatman) using a 96-well plate harvester (TomTek) & then assayed for incorporation of <sup>33</sup>P with a Beta plate counter. "Blank" (no enzyme) and "total" (no compound) control values were used to  
15 determine the dilution range of test compound which gave 50% inhibition of enzyme activity.

In this test, the compounds of the invention give 50% inhibition of enzyme activity at concentrations of 0.0001 $\mu$ M to 1.5 $\mu$ M and in particular compound 8 in Table 3 gave 50% inhibition of enzyme activity at a concentration of 0.01 $\mu$ M and compound 13 in Table 3 gave 50% inhibition of enzyme activity at a concentration of 0.001 $\mu$ M.

(b) In Vitro Aurora-B kinase inhibition test

This assay determines the ability of a test compound to inhibit serine-threonine kinase activity. DNA encoding Aurora-B may be obtained by total gene synthesis or by cloning. This DNA may then be expressed in a suitable expression system to obtain polypeptide with serine-  
25 threonine kinase activity. In the case of Aurora-B, the coding sequence was isolated from cDNA by polymerase chain reaction (PCR) and cloned into the pFastBac system in a manner similar to that described above for Aurora-A (i.e. to direct expression of a 6-histidine tagged Aurora-B protein).

For the large scale expression of Aurora-B kinase activity, Sf21 insect cells were  
30 grown at 28°C in TC100 medium supplemented with 10% foetal calf serum (Viralex) and 0.2% F68 Pluronic (Sigma) on a Wheaton roller rig at 3 r.p.m. When the cell density reached 1.2x10<sup>6</sup> cells ml<sup>-1</sup> they were infected with plaque-pure Aurora-B recombinant virus at a

-65-

multiplicity of infection of 1 and harvested 48 hours later. All subsequent purification steps were performed at 4°C. Frozen insect cell pellets containing a total of  $2.0 \times 10^8$  cells were thawed and diluted with lysis buffer (50 mM HEPES (N-[2-hydroxyethyl]piperazine-N'-[2-ethanesulphonic acid]) pH7.5 at 4°C, 1 mM  $\text{Na}_3\text{VO}_4$ , 1 mM PMSF (phenylmethylsulphonyl fluoride), 1 mM dithiothreitol, 1 µg/ml aprotinin, 1 µg/ml pepstatin, 1 µg/ml leupeptin), using 1.0 ml per  $2 \times 10^7$  cells. Lysis was achieved using a sonication homogeniser, following which the lysate was centrifuged at 41,000g for 35 minutes. Aspirated supernatant was pumped onto a 5 mm diameter chromatography column containing 1.0 ml CM sepharose Fast Flow (Amersham Pharmacia Biotech) which had been equilibrated in lysis buffer. A baseline level of UV absorbance for the eluent was reached after washing the column with 12 ml of lysis buffer followed by 7 ml of wash buffer (50 mM HEPES pH7.4 at 4°C, 1 mM dithiothreitol). Bound Aurora-B B protein was eluted from the column using a gradient of elution buffer (50 mM HEPES pH7.4 at 4°C, 0.6 M NaCl, 1 mM dithiothreitol, running from 0% elution buffer to 100% elution buffer over 15 minutes at a flowrate of 0.5 ml/min). Elution fractions (1.0 ml) corresponding to the peak in UV absorbance was collected. Elution fractions were dialysed exhaustively against dialysis buffer (25 mM HEPES pH7.4 at 4°C, 45% glycerol (v/v), 100 mM KCl, 0.05% (v/v) IGEPAL CA630 (Sigma Aldrich), 1 mM dithiothreitol). Dialysed fractions were assayed for Aurora-B kinase activity.

Each new batch of Aurora-B enzyme was titrated in the assay by dilution with enzyme diluent (25mM Tris-HCl pH7.5, 12.5mM KCl, 0.6mM DTT). For a typical batch, stock enzyme is diluted 1 in 40 with enzyme diluent & 20µl of dilute enzyme is used for each assay well. Test compounds (at 10mM in dimethylsulphoxide (DMSO)) were diluted with water & 10µl of diluted compound was transferred to wells in the assay plates. "Total" & "blank" control wells contained 2.5% DMSO instead of compound. Twenty microlitres of freshly diluted enzyme was added to all wells, apart from "blank" wells. Twenty microlitres of enzyme diluent was added to "blank" wells. Twenty microlitres of reaction mix (25mM Tris-HCl, 78.4mM KCl, 2.5mM NaF, 0.6mM dithiothreitol, 6.25mM  $\text{MnCl}_2$ , 37.5mM ATP, 25µM peptide substrate [biotin-LRRWSLGLRRWSLGLRRWSLGLRRWSLG]) containing 0.2µCi [ $\gamma^{33}\text{P}$ ]ATP (Amersham Pharmacia, specific activity  $\geq 2500\text{Ci/mmol}$ ) was then added to all test wells to start the reaction. The plates were incubated at room temperature for 60 minutes. To stop the reaction 100µl 20% v/v orthophosphoric acid was added to all wells. The peptide substrate was captured on positively-charged nitrocellulose P30 filtermat (Whatman) using a

-66-

96-well plate harvester (TomTek) & then assayed for incorporation of  $^{33}\text{P}$  with a Beta plate counter. "Blank" (no enzyme) and "total" (no compound) control values were used to determine the dilution range of test compound which gave 50% inhibition of enzyme activity.

5 (c) In Vitro cell proliferation assay

This and other assays can be used to determine the ability of a test compound to inhibit the growth of adherent mammalian cell lines, for example the human tumour cell line SW620 (ATCC CCL-227). This assay determines the ability of a test compound to inhibit the incorporation of the thymidine analogue, 5'-bromo-2'-deoxy-uridine (BrdU) into cellular  
10 DNA. SW620 or other adherent cells were typically seeded at  $1 \times 10^5$  cells per well in L-15 media (GIBCO) plus 5% foetal calf serum, 1% L-glutamine (100 $\mu\text{l}$  / well) in 96 well tissue culture treated 96 well plates (Costar) and allowed to adhere overnight. The following day the cells were dosed with compound (diluted from 10mM stock in DMSO using L-15 (with 5% FCS, 1% L-glutamine). Untreated control wells and wells containing a compound known to  
15 give 100% inhibition of BrdU incorporation were included on each plate. After 48 hours in the presence / absence of test compound the ability of the cells to incorporate BrdU over a 2 hour labelling period was determined using a Boehringer (Roche) Cell Proliferation BrdU ELISA kit (cat. No. 1 647 229) according to manufacturers directions. Briefly, 15 $\mu\text{l}$  of BrdU labelling reagent (diluted 1:100 in media – L-15, 5% FCS, 1% L-glutamine) was added to  
20 each well and the plate returned to a humidified (+5%  $\text{CO}_2$ ) 37°C incubator for 2 hours. After 2 hours the labelling reagent was removed by decanting and tapping the plate on a paper towel. FixDenat solution (50 $\mu\text{l}$  per well) was added and the plates incubated at room temperature for 45mins with shaking. The FixDenat solution was removed by decanting and tapping the inverted plate on a paper towel. The plate was then washed once with phosphate  
25 buffered saline (PBS) and 100 $\mu\text{l}$  /well of Anti-BrdU-POD antibody solution (diluted 1:100 in antibody dilution buffer) added. The plate was then incubated at room temperature with shaking for 90min. Unbound Anti-BrdU-POD antibody was removed by decanting and washing the plate 4 times with PBS before being blotted dry. TMB substrate solution was added (100 $\mu\text{l}$ /well) and incubated for approximately 10 minutes at room temperature with  
30 shaking until a colour change was apparent. The optical density of the wells was then determined at 690nm wavelength using a Titertek Multiscan plate reader. The values from compound treated, untreated and 100% inhibition controls were used to determine the dilution

range of a test compound that gave 50% inhibition of BrdU incorporation. The compounds of the invention are active at 0.001 $\mu$ M to 10 $\mu$ M in this test and in particular compound 8 in table 3 was active at 0.086 $\mu$ M and compound 13 in table 3 was active at 0.079 $\mu$ M.

5 (d) In Vitro cell cycle analysis assay

This assay determines the ability of a test compound to arrest cells in specific phases of the cell cycle. Many different mammalian cell lines could be used in this assay and SW620 cells are included here as an example. SW620 cells were seeded at  $7 \times 10^5$  cells per T25 flask (Costar) in 5 ml L-15 (5% FCS, 1% L-glutamine). Flasks were then incubated overnight in a  
10 humidified 37°C incubator with 5% CO<sub>2</sub>. The following day, 5 $\mu$ l of L-15 (5% FCS, 1% L-glutamine) carrying the appropriate concentration of test compound solubilised in DMSO was added to the flask. A no compound control treatments was also included (0.5% DMSO). The cells were then incubated for a defined time (24 hours) with compound. After this time the media was aspirated from the cells and they were washed with 5ml of prewarmed (37°C)  
15 sterile PBSA, then detached from the flask by brief incubation with trypsin and followed by resuspension in 5ml of 1% Bovine Serum Albumin (BSA, Sigma-Aldrich Co.) in sterile PBSA. The samples were then centrifuged at 2200rpm for 10 min. The supernatant was aspirated to leave 200 $\mu$ l of the PBS/BSA solution. The pellet was resuspended in this 200 $\mu$ l of solution by pipetting 10 times to create a single cell suspension. One ml of ice-cold 80%  
20 ethanol was slowly added to each cell suspension and the samples stored at -20°C overnight or until required for staining. Cells were pelleted by centrifugation, ethanol aspirated off and pellets resuspended in 200 $\mu$ l PBS containing 100 $\mu$ g/ml RNase (Sigma Aldrich) & 10 $\mu$ g/ml Propidium Iodide (Sigma Aldrich). Cell suspensions were incubated at 37°C for 30min, a further 200 $\mu$ l PBS added and samples stored in the dark at 4°C overnight.  
25 Each sample was then syringed 10 times using 21-gauge needle. The samples were then transferred to LPS tubes and DNA content per cell analysed by Fluorescence activated cell sorting (FACS) using a FACScan flow cytometer (Becton Dickinson). Typically 30,000 events were counted and recorded using CellQuest v1.1 software (Verity Software). Cell cycle distribution of the population was calculated using Modfit software (Verity Software) and  
30 expressed as percentage of cells with 2N (G0/G1), 2N-4N (S phase) and with 4N (G2/M) DNA content.
